Garnet durai S

Java Backend Developer | DSA | Python | AI Systems

B.E. ECE (2023-2027)

EDUCATION

Bachelor of Engineering (ECE)

Sri Krishna College Of Engineering and Technology (SKCET)

2023 - 2027 - Under Graduate

Relevant Coursework: Python**,** DSA, OOPS, DBMS, Computer Networks. Strong problem-solving and analytical skills with a focus on software development.

SUMMARY

Final-year ECE student focused on backend engineering, data structures, and AI-powered applications. Experienced in building full-stack and intelligent systems using Java, Python, React, and LLM frameworks. **Strong problem-solving** skills with hands-on experience in scalable application design, Chrome extensions, and real-time AI systems.

TECHNICAL SKILLS

Languages: Java, Python, C++, JavaScript, SQL

Backend: Spring Boot, REST APIs

Frontend: React, TypeScript, TailwindCSS

AI/GenAI: LangChain, LLM APIs, Prompt Engineering, YOLOv8, MediaPipe

Databases: MySQL

Cloud & Tools: AWS, Git, GitHub, Streamlit, Chrome Extension API

Core CS: DSA, OOP, DBMS, Computer Networks

PROJECT EXPERIENCE

Orca: Behavior-Aware LeetCode Analytics Extension | 2026

Tech Stack: React, TypeScript, Vite, Chrome Extension API

Engineered a Chrome Extension to track algorithmic fluency by analyzing user behavior on LeetCode, calculating a 0-100% "Confidence Score" based on coding speed, tab-switching focus, and debugging attempts.

- **Developed** a custom Spaced Repetition System (SRS) algorithm that maps behavioral scores to dynamic revision intervals, saving state persistently using the chrome.storage API.
- **Designed** a Multi-Page Application (MPA) architecture using Vite, separating the Vanilla JavaScript DOM-parsing engine from the React/Tailwind frontend.
- **Implemented** copy-paste detection and keystroke tracking via event listeners to accurately differentiate "Thinking Phase" from "Implementation Phase."

AI-Powered Restaurant Name & Menu Generator

Tech: Python, LangChain, Streamlit, LLM APIs, Prompt Engineering
GitHub: GitHub Link

- Built a Generative AI application using LangChain to generate restaurant names and menus based on cuisine input
- Implemented **prompt templates** and **LLM chains** for controlled and consistent AI outputs
- Developed an interactive UI using Streamlit and modular Python code
- Enabled support for **cloud** and local LLM execution for flexible AI deployment

Android Library Management System | 2025

Technical Stack: Java, Android SDK, XML, SharedPreferences, Git

GitHub:GitHub Link

- Developed an Android app implementing **CRUD**, local storage, and search logic
- Ensured UI consistency using Android lifecycle methods and Git-based version control

AI Student Attention Monitoring Dashboard

- **Engineered** an AI-powered student attention monitoring system using **YOLOv8** and **MediaPipe FaceMesh** for real-time distraction, posture, and mobile usage detection.
- **Architected** a low-latency computer vision pipeline that improved attention-state detection efficiency by **~35%** through temporal smoothing, gaze tracking, and facial landmark analysis.
- **Developed** an interactive **Streamlit dashboard** with live analytics, adaptive focus modes, and real-time behavioral feedback for productivity monitoring.
